

GO GREEN WITH RECYCLING

Our idea to open a community recycling Centre inside the university of Mosul main campus to reduce waste to landfill by reusing, re-purposing and recycling as much as possible.

The aim of the project to establish a self-sufficient institution that can employ some graduated students.

The first step of our project start by promoting recycling on campus .

- Create your bins/boxes.
- Develop a communication plan.
- Write an article for your newsletter.
- Write an email to be sent to members of your congregation
- Create signs to encourage members to recycle bottles and cans.

The space required for work: Our project needs a land area of not more than 300 square meters.

Explain by :
 Alaa Ghzwan Nafi Ali Nazar Ahmaed
 Abdulrahman Hussein Ahmed

Tools and equipment needed to complete this project are very simple and available.

- plastic shredder machine
- Waste baler machine
- conveyor belt
- transportation equipment
- small crane

Marketing the product: After collecting the product in sufficient quantities, the packing waste transfer and sold to the plastic recycling plants.

Our project plan does not end at this point, but we are thinking of opening production lines to produce some simple building materials that do not need complex techniques, such as raw materials for building the plastic house used in agriculture. All our wishes are to obtain the necessary support from the University of Mosul or other organizations to start our project as soon as possible
